

an integrated comprehensive stormwater monitoring program for the Puget Sound basin

...or does the 'pay-in' option make you part of the Coalition of the Willing?

WORKING DRAFT - V3

Freshwater Recommendations

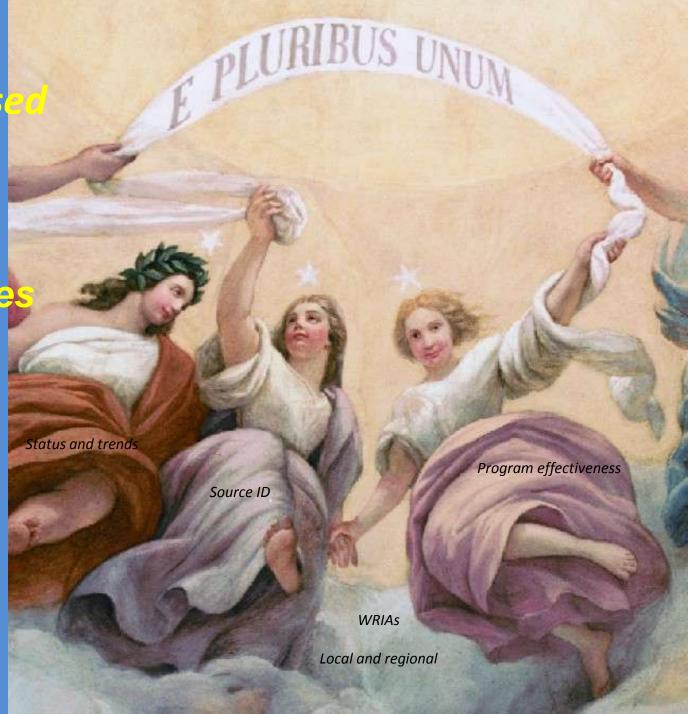

Key Principles

- coordinates and builds on existing local programs
- uses existing and consistent methodology for wadeable streams
- watershed/WRIA scale nested design
- link with source ID
- local impacts of stormwater pollution quantifiable
- support and link to salmon recovery and basin-wide Puget Sound Clean-up efforts

Watershed Based

except for island counties

Puget Sound Stream Benthos

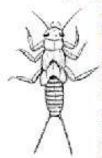

Home Analysis

Monitoring Projects

Login About Us Site Map

Analyzing Stream Health

This site analyzes benthic macroinvertebrate community structure to determine the ecological health of streams. <u>Participating agencies</u> use this site to manage, analyze and share data from their ongoing stream monitoring programs.

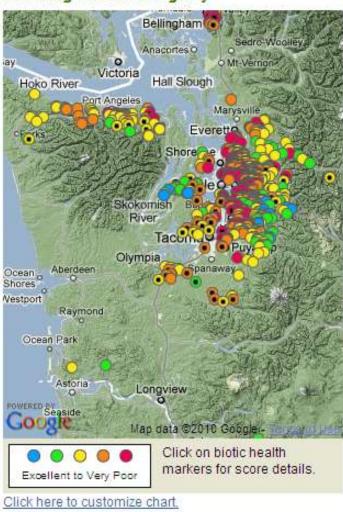

Benthic macroinvertebrates, also known as stream bugs, are animals that can be seen with the naked eye, do not have backbones and live in the stream benthos—in or near the streambed. They include insects.

crustaceans, worms, snails, clams, etc.

Benthic macroinvertebrates are monitored because they are good indicators of the biological health of stream systems and play a crucial role in the stream ecosystem.

2-3 order streams
urban / rural

Plotting Biotic Integrity

The BIBI Scoring System

We use the <u>Benthic Index of Biotic</u>
<u>Integrity (BIBI)</u> scoring system to
determine stream health. Since the BIBI
is a standardized scoring system, it can
be used to compare and rank the health
of different streams

BIBI has several variants, and we will support many of them over time. Currently, we are using Puget Sound Lowlands BIBI. This site allow you to filter the scores by a variety of parameters and then

- · Plot the scores on maps
- Show the scores in tables

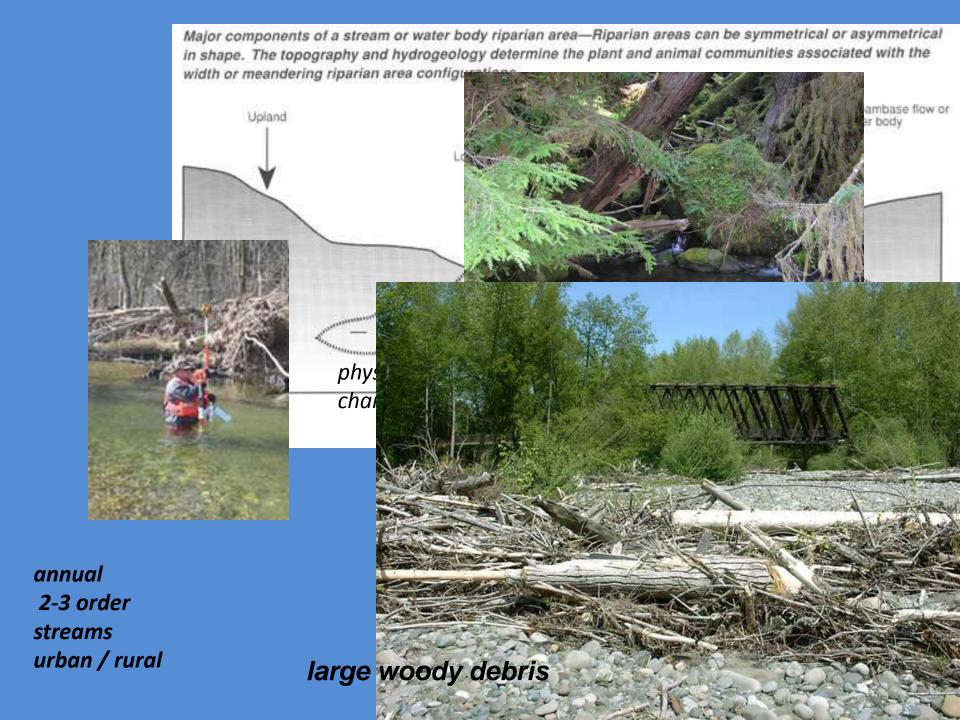

In the future, we will chart trends. We will also calculate scores using other scoring systems.

This program is an example of proposed regionally coordinated data collection and data management

Freshwater: Parameters

National Water-Quality Assessment (NAWQA) Program

U.S. Geological Survey Open-File Report 02-150

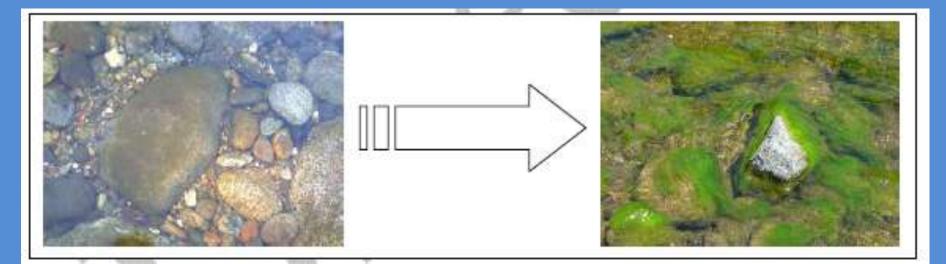

Revised Protocols for Sampling Algal, Invertebrate, and Fish Communities as Part of the National Water-Quality Assessment Program

By Stephen R. Moulton II, Jonathan G. Kennen, Robert M. Goldstein, and Julie A. Hambrook

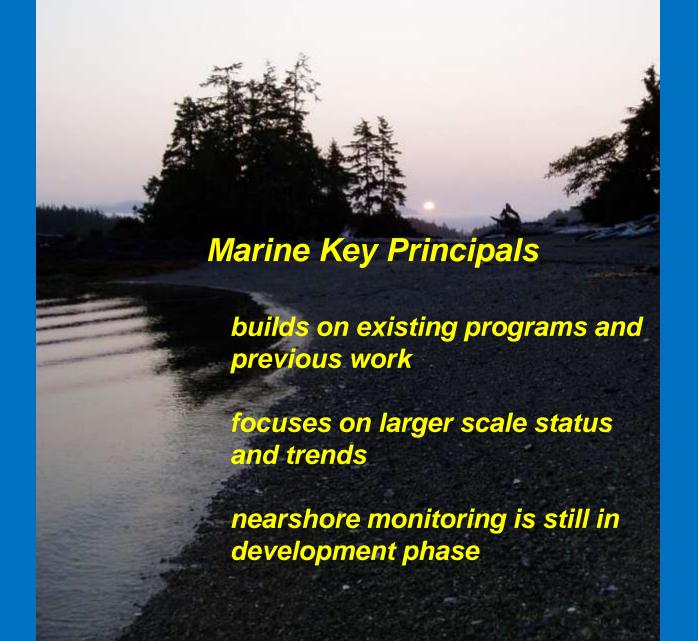

Abstract

Algal, invertebrate, and fish communities are characterized as part of ecological studies in the U.S. Geological Survey's National Water-Quality Assessment Program. Information from these ecological studies, together with chemical and physical data, provide an integrated assessment of water quality at local, regional, and national scales. Analysis and interpretation of water-quality data at these various geographic scales require accurate and consistent application of sampling protocols and sample-processing procedures. This report revises and unifies into a single document the algal, invertebrate, and fish community sampling protocols used in the National Water-Quality Assessment Program.

Analyses Report Recommendations

2012 2013 2014 2015 2016

'Parking Lot' not this cycle, but noted for future

- Prespawn mortality
- Nearshore physical habitat (eelgrass, etc)
- Resident and forage fish indicators need to talk with PSAMP, WDFW, et al.
- Freshwater mussel/shellfish toxicity
- Volunteer efforts
- Regional monitoring linkage with individual jurisdiction permits

and now, lunch
